

User documentation

All components of our project can easily be installed. For now only Linux is officially supported, but it can work under Mac OS and Windows as well with a few tweaks. The C++ library and the command line application can be installed by simply running our install script. The python library can be installed using pip. The web application works on localhost right after cloning the repository. Detailed information is found in the readme section of the respective repositories. Deployment instructions can be found on: <https://www.digitalocean.com/community/tutorials/how-to-deploy-a-flask-application-on-an-ubuntu-vps>
